

We want you to build a Christianity-focused AI assistant.

The assistant should:

- answer Christianity-related questions
- generate Christian content
- generate Christian-themed images
- stay aligned with Biblical context
- avoid hallucinating scripture references
- avoid producing offensive/heretical/toxic outputs
- maintain conversational tone consistency

This is intentionally NOT just a chatbot assignment.

We want to evaluate:

- prompt engineering
- grounding strategies
- multimodal workflows
- AI safety thinking
- hallucination handling
- architecture decisions
- edge-case handling
- product thinking

Core requirements:

- Chat interface
- Scripture-aware responses
- Bible verse grounding/citations
- Christian image generation flow
- Conversation memory
- Basic moderation/safety layer
- Denomination-aware handling (Catholic / Protestant / Orthodox etc.)
- Handling difficult theological questions gracefully

Some intentionally tricky scenarios:

- fake or incorrect Bible verses
- contradictory theological prompts
- adversarial prompts
- attempts to generate hateful/extreme religious content
- “rewrite Bible verse to support X ideology”
- hallucinated historical claims
- image prompts that subtly violate policies

You may use:

- APIs
- RAG
- embeddings
- vector DBs
- open-source models
- image generation APIs
- hybrid systems

You should also create:

- a small evaluation dataset
- edge-case prompts
- adversarial prompts
- hallucination test cases

Deliverables:

1. Working demo
2. GitHub repo
3. Short architecture note
4. 5–8 minute walkthrough

Expected completion time:

~5 hours max using AI coding tools.

We care much more about:

- engineering decisions
- grounding quality
- hallucination prevention
- edge-case handling
- reasoning

than UI polish.
